Subject: Experience with Projects

For the most part, working on the projects went smoothly. Apart from some issues with switching between operating systems, as one of us was on Windows, and the other on Ubuntu, as well as needing to learn how to use new libraries and code bases, we were already pretty well equipped to create programs able to handle the requirements of the projects. Furthermore, our current remote situations did not help, as we struggled to find a good way to handle pair programming from different places. It was much harder to read the other person through voice chat and screen share, but we quickly learned to be more vocal in stopping each other whenever something did not make sense or there seemed to be a more efficient way to do things. We also found it difficult to figure out when to switch who was driving and who was vocalizing code, especially within the first few assignments as the assignments were not too technically challenging. Furthermore, it was much more difficult to share resources we were using online such as documentation, as we needed to send each other links instead of being able to show each other on our own respective devices. Overall, the assignments, while not technically challenging, did bring their own set of problems and issues that we had to work around and solve.
